### Fontavis acquires 17.5 MW "Bondön" wind farm

**Baar/Luxembourg, 18 December 2018 - Fontavis, a Swiss specialist in direct clean energy and infrastructure investments, has acquired the operational wind farm "Bondön" in Sweden. Total capacity of the seven turbines is 17.5 MW and they produce electricity for around 13,000 households annually. The newly acquired wind turbines complement the existing portfolio in Scandinavia.**

Fontavis is expanding its managed portfolio and has acquired an operational wind farm in the Norbotten region in Sweden. The wind farm consists of a total of seven Nordex turbines which have been in operation since 2008 and have an installed capacity of 2.5 MW each. This enables an annual electricity generation of around 36.6 GWh from renewable sources. Thanks to its exposed location on the Bondön peninsula in the Gulf of Bothnia, the wind farm benefits from very attractive wind conditions.

Dr. Marc Schürch, Head of Transactions at Fontavis, is delighted with the successful completion of the transaction: "The Bondön wind farm has a striking track record and provides us with valuable experience for the Swedish wind projects, which Fontavis has already acquired and which will be connected to the grid next year".

"Investments in renewable energies are a priority for our investors. In addition to their sustainable nature, wind parks at preferred locations in Scandinavia offer steady returns and distributions for our clients," adds Thomas Schmid, CEO at Fontavis.

#### **About Fontavis**

Fontavis is an independent fund manager generating sustainable returns from direct investments in clean energy and infrastructure assets. As a FINMA-regulated asset manager of collective investment schemes, the company manages assets in excess of EUR 700 million. The investment portfolio currently includes over 20 investments across Northern and Western European countries. It covers the entire spectrum of energy infrastructure, with a focus on hydropower, on- and offshore wind power, solar power, heating plants and district heating, power grids, as well as waste management companies. The aim is to achieve stable returns through investments in clean energy and infrastructure facilities, and a positive impact with regard to environmental, social and governance (ESG) sustainability criteria (impact investing) through investment activities.
